

9th Policy Briefing

Keep on Track!

June 2015

National Policy Update

Co-funded by the Intelligent Energy Europe
Programme of the European Union

EU Overview

The last edition of the Policy Briefings within the IEE project Keep on Track! starts with an outlook on the on-going and planned EU policy developments with regard to renewable energy from July 2015 onwards.

The Commission clearly articulated its political will in its Communication on the Energy Union package¹ in February 2015 to transform the current centralised conventional energy system, based on fossil fuels and nuclear and built under monopolistic market conditions, into “a resilient Energy Union with an ambitious climate policy at its core to give EU consumers - households and businesses - secure, sustainable, competitive and affordable energy. Achieving this goal will require a fundamental transformation of Europe's energy system.”

The Energy Union Communication highlights the aim to make the “European Union the world number one in renewable energies”.² At its core lies the emphasis on the achievement of secure, sustainable, competitive and affordable energy for all European citizens, which is to be attained through focusing on five “dimensions”, namely: energy security, solidarity and trust; a fully integrated European energy market; energy efficiency contributing to moderation of demand; decarbonisation of the economy; and research, innovation and competitiveness.

The Informal Meeting of Environment and Energy Ministers in Riga in mid-April 2015 added two horizontal topics to the five vertical one, namely financing and the role of consumers with regard to electricity production and to demand-side management.

Within the near future, the European Commission will develop its proposals for a new governance structure as part of the European Commission 2030 Climate and Energy Framework; a redesign of the electricity market; and a revised Renewable Energy Directive. A heating and cooling strategy is planned for the late autumn 2015.

The EU-wide targets and policy objectives for the period between 2020 and 2030 aim at a further decarbonisation within the EU. The targets include 1) a 40% cut in greenhouse gas emissions compared to 1990 levels; 2) at least a 27% share of renewable energy consumption; and 3) at least 27% energy savings compared with the business-as-usual scenario.

¹ [European Commission's communication, Energy Union Package \(COM\(2015\) 80 final of 25 February 2015\)](#).

² European Commission, “ENERGY UNION PACKAGE”, COM(2015) 80 final of 25 February 2015

Co-funded by the Intelligent Energy Europe
Programme of the European Union

In their last policy workshop in June 2015, consortium partners suggested the following list of key characteristics for a future EU energy market:

1. A new system approach: Renewables and energy efficiency as centre piece for a new energy system
2. Promotion of all renewable energy sources and technologies
3. Further developed interaction between the three sectors power; heating and cooling; and transport
4. Increase of flexibility of energy production
5. Focus on regional and de-centralised energy production and consumption
6. The required transmission and distribution infrastructure including a strengthened European interconnectivity
7. Existence of a fully functioning intraday and common balancing markets
8. No to capacity markets
9. Priority dispatch for renewable energy
10. Continued support schemes for renewables
11. Phasing out nuclear and fossil fuels
12. Empower consumers

To reach the ambitious aim to make the “European Union the world number one in renewable energies”, the project results suggest working in parallel on four dimensions:

1. An innovation strategy coupled with a robust industrial policy to maintain or regain our leadership;
2. Vivid domestic market, condition sine qua non for a world leadership;
3. Support to export opportunities providing solutions for developing countries;
4. Ease access to capital through a de-risking strategy for renewables projects requiring upfront investment.

The on-going and planned policy and legislation developments over the next two years offer the chance to develop renewables as critical means for a stable, secure, affordable and democratic energy system for the European Union, a system which generates jobs and wealth and helps expanding and pacifying access to energy around the world.

Programme of the European Union

AUSTRIA

Dipl.-Ing. Jurrien Westerhof
 EEÖ – Renewable Energy Austria
 EEÖ – Erneuerbare Energie Österreich
www.Erneuerbare-energie.at
jurrien.westerhof@erneuerbare-energie.at

Renewable energy in Austria – recent developments

Historically, Austria places high importance on the use of renewable energy (hereafter “RE”)) and elaborates ideas for its continuous development. Overall, the share of renewables in the different sectors is growing, but nevertheless last year’s developments gave rise to concerns. The introduction of the Austrian Energieeffizienzgesetz (law on energy efficiency) has a mandatory target for the reduction of energy demand, which is a good step, but chose a very complicated regulative approach instead of a much easier eco tax reform. Low market prices, generally for electricity and especially for fossil energy products, currently pose a severe threat to all sectors of the renewable energy industry.

Policy update in Austria

What is happening in the electricity sector?

Uncertainty as result of new state aid guidelines: the decision of the EU commission to change the state aid guidelines means that sooner or later Austria will have to revise its eco-electricity law. It is becoming clear now that conditions will be less favourable, which already leads to uncertainty among investors.

Unambitious 2030 targets: the targets agreed by the EU council are very low, which means that investments in renewable energy may drop to approximately half of current investment level.

Low electricity prices: The current extremely low electricity prices are a serious threat to generating plants without feed-in tariff, which discourages investors and increase the costs of the feed-in-tariff system.

Co-funded by the Intelligent Energy Europe
 Programme of the European Union

What is happening in the heating and cooling sector?

Low oil prices: even if renewable heat is still cheaper than fossil heat, the current low oil prices slow down the replacement ratio of old oil heating systems by modern renewable heating systems.

Competition from heat pumps: due to low investment costs, heat pumps become increasingly popular. This leads to a higher electricity demand just during winter, with low renewable power generation.

Weak renovation incentives: since many years, investments in saving heating energy are much too low, leading to a less than 1% thermal renovation ratio. Due to low oil and CO2 prices, current subsidies are as incentive too weak to increase the ratio to the needed 3%.

What is happening in the transport sector?

Too slow transition from road to rail transport: Public rail transport is becoming increasingly popular, but investments in commuter railroads and trains are lagging behind. This slows down the transition towards a renewable energy transport system (trains use 95% renewable power).

Incentives for E-mobility not strong enough: There is a lot of discussion about E-mobility but not many electric cars. This is due to the cars still being too expensive. However, other countries show that tax incentives are an effective way to make E-cars (or plug-in hybrids) more attractive.

Low biofuel targets: Austria reduced its biofuel target from 10% to 6.75%, after a change in the EU policy. However, overall fuel demand is falling, leading to lower absolute amounts of biofuel, whereas production could be increased when environmental aspects are considered.

What are your key recommendations for a future EU governance system?

A good future European energy policy governance system should set clear, ambitious and nationally binding targets for CO2 emissions, energy saving and the share of renewable energy.

The targets should reflect the call for urgency from climate science.

Member states should have the freedom to decide with which instruments they want to achieve their targets, however the EU should introduce a Europe-wide CO2 tax system as replacement for the ETS trading systems, since the latter is not working.

An energy efficiency target should be replaced by an energy saving target – we do need more efficiency, but above all we need a reduction of energy demand.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

What are your key recommendations for a future EU energy market design?

Central guiding instrument at the European energy market should be an EU-wide CO2 tax, combined with border tax adjustments to prevent carbon leakage. The tax level should follow the IEA recommendations for the 2°C/450 ppm scenario: 22 US\$/t in 2020, 100 US\$/t in 2030 and 140 US\$/t in 2040. All direct and indirect subsidies for fossil and nuclear energy should be abolished immediately and all external costs should be internalized.

-
- De-central energy generation and consumption should have priority
 - Renewable power feed-in should have priority in grid access.
 - Conditions for increasing the share of renewable power should be stable and predictable, and feed-in tariffs have proven to be the most effective support mechanism.
 - It needs a phase-out plan for fossil power generation, starting with coal, to provide clarity to utilities operating these plants.
 - Incentives are needed to make power generation and demand more flexible.
 - It needs a Europe-wide electricity labelling system with internationally acknowledged guarantees of origin, where power and certificate cannot be traded separately.
 - It needs a uniformed European regulation for grid costs.
-

BELGIUM

Fawaz Al Bitar

EDORA – Belgium Renewable Energy Federation

Fédération de l'Energie d'Origine Renouvelable et Alternative

www.edora.be

falbitar@edora.be

Lack of clarity regarding the middle term renewable vision in Belgium

In Belgium, there is a dramatic lack of coordination between the regional and the federal governments. The federal authority is in charge of the energy security and is currently faced to unexpected and sudden loss of nuclear power capacity (cracks, technical incident or sabotage...). However, the renewable development is mainly within the competence of the regional authority only interested in the short-term lowest cost energy production. There is therefore currently no nuclear replacement scenario and no middle term renewable vision in Belgium.

Policy update in Belgium

More than 8% of the Belgium energy consumption is provided by renewable energy sources. Although Belgium is currently on track, it is likely that Belgium will have difficulties to reach its mandatory renewable target for 2020. This is mainly due to lack of visibility in the support system, lack of middle term energy vision and increasing number of constraints for the development of some renewable technologies. The renewable consumption percentage is shared between the three energy sectors as followed: more than 12% of RES-E, more than 8% of RES-H&C and more than 4% of RES-T.

What is happening in the electricity sector?

The support system has been adapted with sometimes a significant support decrease for some technologies (e.g. PV support for household in Flanders). The support system aims to reach a determined internal rate of return for producers in function of the current cost of development and the electricity market price. In Wallonia, the precise link with the electricity price is however not known yet, leading to major lack of investment security. In Flanders, there are some initiatives to progressively replace the current green certificate support by an investment support for some technologies. A combined approach between investment and production support is considered.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

There is a lack of longer term vision regarding the renewable development in Belgium. The federal government will start in 2015 a so-called Energy Pact that aims to elaborate a back casting scenario based on the nuclear phase-out due to 2025. This replacement scenario must be developed together with the regions and is expected to bring more visibility on the future renewable development in Belgium. Wallonia has adopted in April 2015 (first reading of the legislation) new targets for each renewable power technology. The level of ambition has been significantly decreased since the last government.

In order to facilitate the administrative procedure, Flanders is currently considering a one-stop shop in permit delivering for some technologies. In Wallonia, the adoption of new permit delivering system for wind energy in Wallonia based on a tender mechanism has been aborted and will not be analysed by the new government. The current system based on the “first-come, first-served” principle is therefore still valid.

In Wallonia, the spatial planning for wind energy has been abandoned. In Flanders, there are planning initiatives in different provinces in Flanders and also from the Flemish spatial planning administration but there is little or no coordination between the different initiatives. The potential for wind energy is mapped to create some large scale projects.

The environmental constraints are currently excessive, not objective and sometimes without scientific basis. Consequently, the renewable sector is currently in negotiation with the relevant administration in order to elaborate a compromise protocol (especially for wind energy) to be proposed to the authority.

The regional governments, in good collaboration with the renewable sector, are going to start negotiations with the federal government in order to reduce the importance of military and ATC constraints and to objectivise some criteria in order to allow wind farm installations in some military training zones currently forbidden and in the vicinity of airports and radars.

What is happening in the heating and cooling sector?

The H&C renewable sector is still lacking a specific and coherent support mechanism (e.g. via green certificate). The current investment support together, with some required and detrimental criteria, lead to insufficient promotion of an adequate RES-H&C development. In Flanders, the new government pledged for a priority access to the grid in favour of biomass production.

What is happening in the transport sector?

The RES-T sector is still suffering from a lack of coherent and targeted support mechanism and from a lack of clarity regarding the biofuels criteria.

Renewable energy in Bulgaria – arrested development

The former Bulgaria government declared a virtual war on the renewable energy sources. For the past couple of years the government has been using the mainstream media to create a negative image of RES and accompanied the campaign with a wave of retroactive changes in the legislation. Recently the Ministry of Economy and Energy announced that the support scheme for renewables had to be reconsidered as a way of assuring affordable electricity prices for households.

Status of the RES production in Bulgaria

According to the Second National Renewable Energy Action Plan Progress Report, published by the Ministry of Economy and Energy, Bulgaria has already achieved its 2020 targets and has reached a share of 16.4% renewable energy use in gross final energy consumption. As a result, the incentives for newly installed renewable energy power plants shall be discontinued. Unfortunately, the alternative progress report prepared by the Association of Producers of Ecological Energy showed that the official figures have been inflated with about 1.6%.

Policy update in Bulgaria

What is happening in the electricity sector?

In December 2013, the government introduced a 20% tax on the income of renewable energy producers. The tax applies only to wind and PV installations, despite the fact that the measure is discriminatory and in clear violation of the Bulgarian Constitution and several obligations under the legislation of the European Union.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

In August 2014 the Constitutional Court revoked the tax but its decisions have no retroactive force and the collected sums will not be recovered.

In January 2014, the Ministry of Economy and Energy published the Second Progress Report which stated that the Bulgarians 2020 target has been achieved. As a result, the incentives for newly installed renewable energy power plants shall be discontinued.

Further, in February 2014, the State Energy and Water Regulatory Commission (SEWRC) approved a permanent grid access fee only for wind and PV producers. The price for it amounts to 2.45 BGN/MWh and it will be paid to the Transmission System Operator. The fee will be applied retroactively as of September 18th 2012.

Meanwhile, the Supreme Administrative Court has revoked the provisional grid access fee from September 18th 2012 so the SEWRC has determined a mechanism to compensate the producers with a deadline to April 15th 2014.

From March to June 2014 the distribution system companies (EVN, CEZ and Energo Pro) have been limiting the maximum power generation of all wind and PV power plant by 60%. The move has been ordered by the Transmission System Operator due to imbalance between the production and consumption of electricity.

What is happening in the heating and cooling sector?

The Ministry of Investment Planning announced that they were preparing tax reliefs and financial incentives for households who use renewable energy appliances in their buildings. The amendments should be implemented to the national legislation by the end of the year.

What is happening in the transport sector?

The Ministry of Economy and Energy has formed a working group for developing a draft of a new National Electric Mobility Action Plan. The main priority of the action plan should be development of policies and incentives for accelerating the e-mobility deployment.

What are your key recommendations for a future EU governance system?

- Ensure that the current nationally binding targets for 2020 will be met, also after 2020;
- Keep and enhance the existing mechanisms that aim to remove regulatory barriers;
- Keep and enhance demand-side mechanisms;
- Introduce an investor complaints procedure that can trigger an infringement procedure.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

What are your key recommendations for a future EU energy market design?

- Full achievement of the EU-wide target model including integrated and well-functioning intraday and balancing markets.
- Refocusing liberalization efforts away from the power supply side solely, in order to include demand side participation and storage in the medium to long term.
- Implementation of the most important grid reinforcements at national, regional and EU-wide level as a necessary precondition of any successful market design reform, based on thorough cost-benefit analyses.
- Carry out an ETS reform which will provide for a high and stable carbon price, thereby creating market exit signals for carbon-intensive and inefficient power plants and functioning as a tool to create longer term investment signals for all abatement options.

GERMANY

Corina Bolintineanu
 German Renewable Energy Federation
 Bundesverband Erneuerbare Energie (BEE)
www.bee-ev.de
corina.bolintineanu@bee-ev.de

Bleak outlook for Germany's Energiewende

Germany finds itself in the middle of a debate about the future design of power markets, with the White Paper detailing a range of recommendations on how to further develop them. The introduction of the “coal levy” was dropped in favour of an alternative to gradually shut down coal-fired power stations. The first of its kind pilot auction for ground-mounted PV systems concluded in April 2015.

Status of the RES production in Germany

In the first half of 2015, renewable energy accounted for 14.3 % of gross final energy consumption (2014: 12.9 %). In the power sector, RE accounted for 32.5 % of gross electricity consumption (2014: 27.8 %). In the heating and cooling sector, the proportion of RE increased slightly to 10.8 % of total consumption (2014: 9.9 %), while in the transport sector the share of renewables continued to decrease, RE accounting for only 5.1 % of fuel consumption (2014: 5.4 %).

In 2014, wind power and photovoltaic energy were the predominant energy sources in the power sector. Wind power accounted for 34.8 % of gross electricity consumption (34.0 % wind onshore and 0.8 % wind offshore) and solar power for 21.7 %. Biomass accounted for 30.6 %, of which 18.1 % biogas. In the heating and cooling sector, biomass accounted for 86.6 % of total consumption, geothermal energy for 8.1 % and solar thermal energy for 5.3 %. In the transport sector, biodiesel remains the main energy source.

As regards renewable energy investment, it picked up in 2014, with an investment volume of about €18.8 billion (2013: €15.7 billion).

The development of renewable energy is also an important climate change mitigation measure. In 2014, RE helped avoid 148 million tons CO₂ emissions.

The renewable energy sector in Germany employs some 371,400 people.

Co-funded by the Intelligent Energy Europe
 Programme of the European Union

Policy update in Germany

What is happening in the electricity sector?

The Federal Ministry for Economic Affairs and Energy (BMWi) published a White Paper on the future power market design entitled “An electricity market for the energy transition”. The ministry advocates the further development of power markets towards an “electricity market 2.0” and opposes the introduction of a capacity market. As regards the content of the White Paper, it addressed issues such as the introduction of a capacity reserve, increasing flexibility, monitoring security of supply, the further development of balancing capacity markets, etc.

Following the amendment of the EEG (Renewable Energy Sources Act) in 2014 and the passing of an Ordinance regulating the pilot auction for ground-mounted PV systems, the BNetzA (German Energy Regulator) organized an auction that attracted 170 bids and awarded 156.97 MW in capacity at an average price of €91.70 per megawatt hour.

The BMWi also proposed the introduction of a “coal levy”. The measure was intended to cut coal-sector emissions by a further 22 million tons by 2020. Because of a backlash from industry and unions, the proposal was dropped in favour of an alternative to gradually shut-down coal-fired power stations and offer more financial support for combined heat and power plants, along with other measures.

What is happening in the heating and cooling sector?

The deployment of renewable heating is progressing slowly. The current low oil and gas prices, as well as the planned but once again failed introduction of tax incentives for retrofitting the existing building stock have negatively impacted the market. Starting April 2015, the main financing instrument for renewable heating, the MAP (Marktanreizprogramm) will increase the public grants offered to some technologies.

What is happening in the transport sector?

Biofuels: The biofuels industry fears even lower sales than in previous years. Germany is the only country which has transposed the FQD (Fuel Quality Directive) through a change from the existing biofuel quota to a GHG reduction target. Since the beginning of 2015, the industry is trying to adapt to the new system.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

Electric mobility: The calls for increased public support for electric mobility are getting louder. An initiative of the German Federal Council (Bundesrat) asks for the introduction of a temporary special depreciation until 2019 for the acquisition of electric vehicles and charging stations for commercial use.

What are your key recommendations for a future EU governance system?

In April 2015, BEE published its key points on the new 2030 Governance Framework. These include guaranteeing investor certainty by providing a clear and timely indication of Member States' contributions to meet the overall European goal, increasing the cooperation and coordination among Member States, ensuring the achievement of the European renewable energy target of at least 27 % by 2030, etc.

What are your key recommendations for a future EU energy market design?

In April 2015, BEE published its key points on electricity market design. These include increasing the flexibility of the power system, strengthening European connectivity, avoiding the introduction of capacity markets, creating common balancing markets, etc.

The implementation of new renewable energy projects constitutes a major challenge for the new Greek government

The development of new renewable energy or renewable energy (hereafter "RES") related projects in Greece has practically come to a standstill following the results of the national elections held in January 2015. Although the new Government has not publicized relevant analytical plans, officials have indicated that they intend to increase the degree of state participation in and control of the RES market as a basis for the further development of RES in the country. The implementation of such a policy would constitute a major challenge to the effective further implementation of RES projects at the national level.

Status of the RES production in Greece

The following table summarizes the installed RES capacity and the RES energy generated in Greece at the end of 2014 by RES technology and compares it with the other fuels used for power generation. It also shows the NREAP 2020 targets by RES technology capacity. Please note that the figures for PV installed capacity and production do not include small rooftop PV systems which are not counted towards the achievement of the 2020 targets and which amounted to around 350 MW at the end of 2014.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

GREECE: INSTALLED CAPACITY AND ELECTRICAL ENERGY GENERATED IN 2014

Greek Association of RES
ELECTRICITY PRODUCERS

Policy update in Greece

Since the election of the new Greek Government and despite the deepening financial crisis, it has been able to continue paying the RES-E producers with a four-month-delay.

However, all new RES project development has come to a standstill in anticipation of the formulation and finalization of the new government's plans in the energy sector and in particular for RES. The outcome of the negotiations between Greece with its creditors and EU partners concerning the fate of Financial Aid Program for the country and the national debt is expected to be definitive in this context.

Government officials have indicated that they intend to increase the degree of state participation in and control of the RES market as a basis for the further development of RES in the country. As more than 95% of the existing and planned RES projects in Greece are owned, operated and developed by independent power producers (IPPs) and other stakeholders from the private sector, the implementation of such a policy would constitute a major challenge to the effective further implementation of RES projects at the national level.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

What is happening in the electricity sector?

Many mature wind projects are up in the air, despite the fact that they have ensured financing, as they await the decision of DG Competition on whether the recently notified national support scheme for RES known as the “New Deal” complies with the new EU State Aid guidelines and, of course, the relevant policy decisions of the new Greek government.

Moreover, the implementation of new wind farms, especially the “big” ones, is now facing increased opposition from environmental groups which are politically close to the new government.

RES and other energy market stakeholders continue to stress the importance of implementing long-standing plans to electrically connect the Greek islands to the mainland. The Government has indicated that it would seriously consider moving in this direction. However, it wishes to re-evaluate these plans and, thus, final decisions are not to be expected in the immediate future.

Following the issuance of a relevant ministerial decision in December 2014 the Greek DSO has started to accept applications for PV net-metering installations. This is expected to eventually strengthen PV based distributed generation nationwide.

What is happening in the heating and cooling sector?

No new measures promoting the implementation of RES-H&C projects have been adopted by the new government yet.

What is happening in the transport sector?

No new measures have been taken recently to increase the share of biofuels in the national automotive fuel mix.

Potential investors and other interested stakeholders continue pushing for the introduction of electric vehicles in the Greek automobile market. However, the lack of a basic framework for promoting green e-mobility is a serious barrier to the implementation of RES-T projects even at the pilot scale level.

Retroactive measures threatening RES sector: future is uncertain despite good potential

Currently – July 2015- there are no significant changes compared to the last update in the 6th policy briefing, apart the publication of the draft of the Decree on the support scheme, currently under discussion. The draft maintains the same structure of the previous Decree (auctions and registries) reducing the incentive amount until 31/12/2016. Support scheme for renewable energy production, already ceased for PV sector and reduced for other RES (no PV), will gradually decline. Finally, the retrospective reduction of the existing incentive introduced by "Spalma-incentivi" measure, heavily impacting on investments already started, is now under the examination of the Court, which has to pronounce about the constitutionality of such measure.

Status of the RES production in Italy

The trend shown in the 6th policy briefing continues. According to data from Terna (TSO) renewables have produced 7% more than in 2013, and cover energy needs for the 40.1%. The official publication by TSO and GSE of the comprehensive figures for 2014 and first half of 2015 is still expected.

Policy update in Italy

What is happening in the electricity sector?

- **Support scheme for RES (except PV)**

In 2014, after the publication of the rankings of the 3rd and last call for auction and registries, support for RES-E other than PV has stopped. From now on Italian producers will not enjoy a support scheme for their new plants, and for the existing ones the support scheme has been reduced, according to "Spalma-incentivi" measure. Currently, only small plants with direct access can benefit from the incentive until the amount of the expenditure ceiling, - 5.8 €million - is reached.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

- “Spalma-Incentivi”: retroactive changes in PV support scheme

The Law 116/2014 entered into force on the 11th of August 2014, transposing the requirements of the Decree 145/2013 (“Spalmaincentivi”). With this measure the Government establishes that, from the beginning of 2015, all PV plants >200kW (except those whose incentive period expiring on the 31st of December 2014) are subject to a reduction in the rate previously accorded. The appeal against the retroactive measure of “Spalmaincentivi”, coordinated by assoRinnovabili, has been favourably upheld by the Administrative Court, which has then deferred it to the Constitutional Court: operators are now expecting the final pronunciation.

- “Spalma-Incentivi”: reduction of support scheme for RES (bioenergy, hydro, wind)

This measure applies to all RES other than PV not regulated with the Decree 6 July 2012. The Decree, published on the 6th of November 2014, imposes a choice between two alternatives. The first consists in reducing the amount of the support depending on the type of RES and on the residual period for which the support is accorded (with possible lengthening until seven years more). The second alternative (which applies automatically, if no communication asking for the first option is sent to GSE) is to maintain the existing support scheme until its end without providing any other incentive for O&M intervention and remaking for the following 10 years.

Up to now only few operators, mainly for hydro source, expressed a choice between the two alternatives.

What is happening in the heating and cooling sector?

- Transposition of the European Directive 2012/27/UE with the Decree 102/2014

On the 4th July 2014, the Directive 2012/27/UE has been formally introduced in the national legislation system with the Decree 102/2014. In particular, art. 15 establishes a reserve fund for energy efficiency to be allocated to district heating networks in the agricultural sector and / or related to distributed generation from biomass.

- National Energy Efficiency Plan published

The National Plan for Energy Efficiency, published in July 2014, describes the targets on energy efficiency established for Italy at 2020: 15.5 Mtoe of final energy consumption and 55 ml/tons CO2 avoided. Main tools to ensure the achievement of these goals are the “Conto Termico” for heating, the Energy Efficiency Certificates and many fiscal facilities for interventions upgrading the energy efficiency of the housing stock.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

What is happening in the transport sector?

On the 12th of February 2015, the Authority – AEEGSI- published the official operational arrangements on the connection procedure and on the definition of the amount eligible to receive the support established with The Ministerial Decree 05.12.2013. But effective projects require many measures, starting from a stable and clear legal system, consistent with the sector's needs to foster long term investments. The publication of these measures is slow and not well co-ordinated, although the potential could be really high, being Italy ranked fourth in the world for number of NG vehicles (400.000 units, data from Federmetano).

What are your key recommendations for a future EU governance system?

- Define a clear minimum binding target for each member state in order to ensure the achievement of 27%
- Define measures against no compliance
- Encouraging member states to aim to higher objectives and establish incentive mechanisms for those who go beyond the minimum target assigned
- Check timely the results achieved and the barriers, with a transparent and regular monitoring
- Check national action plans, asking for modifications

What are your key recommendations for a future EU energy market design?

- Voluntary participation of RES to Ancillary Services Market, remunerated according to market principles
- Need to remove constraints to long term contracts and to introduce regulatory instruments in order to push demand to long – term contracts, i.e. limited liability consortiums, minimum quotas under market principles, etc.
- Limited development of capacity market is expected as a consequence of current system overcapacity and the evolution of the generation mix
- Bring market gate closure in Intraday Market nearer to real – time
- Impulse towards virtual gathering of more plants (i.e. Germany).

RES Act finally adopted, still no RES development strategy for beyond 2020

The Parliament adopted new RES Act on 20 February 2015. The new support system which is based on technology neutral auctioning system and feed in tariffs for installations <10kW, will be active from 2016. Financing of biomass co-firing is still included in the new system, although it is limited. It is perceived that the new support scheme will not give sufficient incentives for investors to enter into RES. The Act sets the frames for support system, but there is no long-term development strategy for RES beyond 2020.

Status of the RES production in Poland

The development of RES in Poland is continuing, despite the unfavourable market situation, investors try to finalize RES installations (wind power in particular) to be included in the green certificate scheme, as the new system is perceived as even less favourable. Total RES share in energy consumption in 2014 planned for 11, 45% was expected to be achieved.

Total installed capacity in RES technologies in the first quarter of 2015 was 6 155MW (plan 6 074MW for 2015). Installed capacity in wind is 3951MW and it is 411MW bigger than planned for 2015. There are 257 biogas plants installed with a total capacity 190 MW (from which only 67MW is from agricultural biogas plants). Installed capacity in photovoltaic is 27MW with an insignificant growth by 5MW.

A continuous increase in installed capacity is expected for 2015, mainly in wind power and solar power (small presumes' installations). In 2016-2017 the investments in RES would most likely to slow down, as investors who will win auction, have 24 months (48 for off-shore wind) to start energy production. However, due to the possibility of co-financing from structural funds, developments of smaller installation could keep increasing.

 Programme of the European Union

Policy update in Poland

What is happening in the electricity sector?

After four years, the new RES Act was adopted in 2015 setting principles of RES support based on technology neutral auctioning system which will not be active until 2016. Apart from the auction scheme a feed-in tariff for micro-installations (<10 kW) is introduced.

Prices of green certificates are still very low. Nevertheless, developers try to finalise their installations in 2015, not trusting that the new support system will be more advantageous.

The RES Act sets a very complicated administrative system and raises many interpretation questions; the Ministry of Economy already proposes an amendment. The Res Act does not propose any predictability for developers, as auction quotas as well as reference prices are set solely by the government every year. It illustrates a lack of political will to develop RES beyond EU requirements.

What is happening in the heating and cooling sector?

The new RES Act adopted by the Parliament includes support only for CHP. There is neither a complex strategy nor a support scheme for heating and cooling sector. The scheme of red and yellow certificates will expire in 2018; and there is no strategy for the RES development in heating and cooling sector afterwards.

What is happening in the transport sector?

EU laws are finally implemented by amending existing acts in January 2015, introducing among others more effective promotion of RES use in fuels and a transition to E10 till 2020.

What are your key recommendations for a future EU governance system?

In order to coordinate efforts of Member States to achieve binding target of 27 % of electricity from RES in 2030, in absence of national targets, the EU needs a robust and coherent governance system based on nationally binding renewable energy policies. The crucial issue is to provide investors with predictable and stable environment until at least 2030, which will give them investment certainty. That is particularly important for countries such as Poland, in which renewable energy is not a priority.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

What are your key recommendations for a future EU energy market design?

The concept of capacity market is not in line with a paradigm of development of distributed energy system. It generates additional costs and distorts national energy markets, blocking development of new capacities utilising more advanced technologies.

The RES support systems should be continued, especially taking into consideration that systems based on fossil fuels benefit from different types of subsidies and we could not really talk about a level playing field for all types of energy generation.

For large scale installations the auctioning systems should be harmonised across the EU.

In case of smaller energy generation, the focus should be on development of regulatory and balancing energy generating installations, e.g. on biogas installations of 1 MW with large chemical energy storage (sector of independent energy producers).

In general decentralisation of auxiliary services and regulatory sources in virtual energy power plants should rather be the priority, not electrical energy generation.

In prosumers' sector, focus should also be on energy storage installations (heat, electricity and biogas storage).

PORTUGAL

APREN

Associação
de Energias
Renováveis

António Sa Da Costa

Portuguese association of renewable energies

Associacao Portuguesa de energias renovaveis

sadacosta@apren.pt

www.apren.pt

The first semester of 2015 shows a slowdown in the RES sector though renewable energy is still the main contributor for electricity consumption

In the first semester of 2015, RES-E continue to be the main share of electricity consumption in Portugal mainland, but with a slightly reduction leaving some reservations about the achievement of 2020 targets. Moreover, the self-consumption regulation is finally fully operational. The Green Tax Reform is been implemented, but the impact in the deployment of electric vehicles has been so far negligible. The RES-H&C continues with a lack of stronger support.

Status of the RES production in Portugal

At the end of the first semester of 2015, RES uphold the biggest share of electricity consumption in Portugal mainland with 54,1%, though this share had a significant drop since the beginning of the year, mainly because it has been a dry year. The market is stagnated with no further developments foreseen, mainly due to lack of deployment and strategic policies, which continues to cause some reserves about the achievement of 2020 targets. In the end of 2014 the RES-E share was 51,7%, quite below the target share of Portugal, which is 60% in 2020.

The next figure shows electricity production share in 1st semester of 2015 from RES. Within RES-E, wind has been the main source of electricity generation with 23.7%, followed by hydro power generation with 21.8%. Since the beginning of year, there was a switch between the share of hydro and wind, because hydroelectric production has been below average due to a dry year. The remaining technologies have globally a share inferior to 10%, biomass represents 5.0%, small hydro

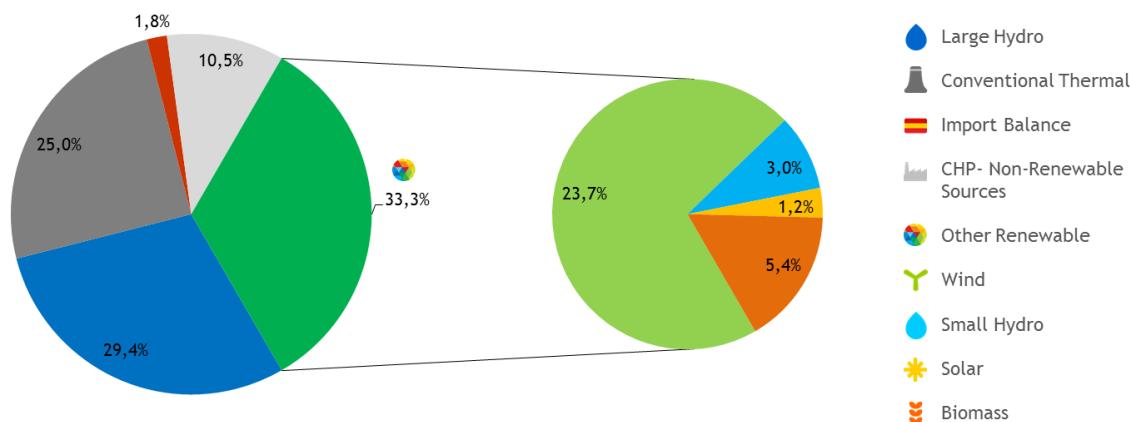

Co-funded by the Intelligent Energy Europe
Programme of the European Union

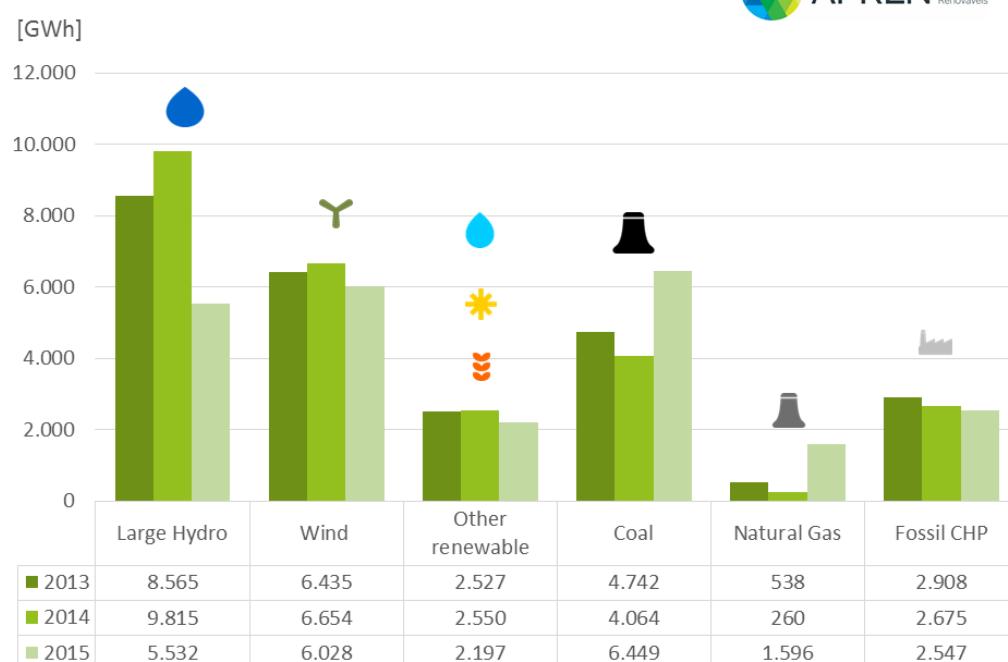

2.1% and solar photovoltaic (PV) 1.5%.

Share of electricity sources in total consumption
in Portugal Mainland in 2014

Comparing with the homologous periods of the last 3 years, it is clear that the present year is quite dry, what is translated in a raise of the thermal fossil share of the electricity production sector with a particular emphasis on coal.

Evolution of electricity production per source
January to June 2015

Programme of the European Union

Policy update in Portugal

What is happening in the electricity sector?

Since the beginning of the year, RES-E sector is struggling with lack of deployment policies. Presently, the new RES-E projects have no incentive mechanisms; they have integrated in the regular energy market. Moreover, the RES plants with FiT will gradually be transferred to market regime from 2018 and there is still no clear strategy how this will occur. So, investments in the field have stopped.

In June 2014, it was published the framework for wind farms' overpowering that sets a FiT of 60€/MW for the over-equipment to be installed and defines the concept of additional capacity, enabling the removal of existing limitations on the injection of electricity. Finally the metering and technical specifications were published, though the metering guidelines require individual metering, which increases the investment cost, or a discount rate in production is applied. This fact has hold down the investment in over-equipment and reduces the expectation power raising for wind sector.

The new self-consumption and FiT regime regulation for small units has been published in October of 2014 (decree law 153/2014), which repeals the old FiT scheme. It defines rules for self-consumption systems with grid-connection, which had no regulation before, and new rules for FiT scheme (systems under 250 kW). The regulation is fully operational. It is estimated that the installed solar PV power under this scheme can reach up to 300 MW in 2020, which is a poor contribution of the overall system, when Portugal has a great natural capacity.

The Green Tax Reform has been under implementation since January 1st of 2015. It was established that a new value for the maximum tax depreciation of wind and solar technologies has set at 8%, which represents twelve and half years (minimum is twice this value). The proposal of reducing 50% of the Municipal Real Estate tax (IMI) for RES power producing buildings was accepted and will be carried out within five years, though the conversations between representatives of the sector and the government regarding the most accurate method to calculate the IMI for wind and PV power plants is still going on.

Regarding the compensation regime applicable to RES-E promoters published in February 2013, SHP promoters keep on trying to reach an agreement with the Government. Likewise, promoters also expect a revision of the new licensing regime published in August 2013, which has set deadlines hard to comply with that can jeopardize RES-E projects.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

What is happening in the heating and cooling sector?

There is currently no direct support mechanism for RES-H&C; the Energy Efficiency Fund has not renewed the budget to support RES-H&C equipment installation in the household sector and the fiscal benefits removed after 2010 were not re-established, even if this was one of the proposals assessed by the Green Tax Reform Commission.

According to the Portuguese Energy Performance of Buildings Decree law 118/2013, the new buildings have to install solar thermal systems not only for domestic hot water, but also for space heating, though only if the orientation of the building is suitable. Besides, this regulation enhances slightly the energy class of the building when there are solar systems installed or biomass boilers, which benefits the monetary value of the building in the market.

With the new self-consumption and FiT regime regulation RES-H&C sector is going to be indirectly supported via an increase of the FiT for producers who combined the systems with solar thermal solutions or/and biomass boilers, though it worth noticing that it was an obligation to install solar thermal in the old micro generation system.

Moreover, the Green Tax Reform sets a 15% reduction on IMI for buildings with high energetic class for 5 years, but this must be deliberate in municipality session.

What is happening in the transport sector?

The provisional numbers of 2014 show that the quota scheme for all biofuels of 5.5% in energy content was achieved, going in the right path to achieve 10% in 2020. There was also the obligation to blend a minimum of 6.75% (v/v) of biodiesel in diesel for road transports until the end of 2014 that was also reached. Starting from this year there is a specific obligation to incorporate 2.5% in energy content of gasoline substitute biofuels, though there are doubts regarding this matter, due to the reluctance of Portuguese refineries sector. So it is expect that specific biofuel will be imported to reach this target.

Furthermore, the Green Tax Reform Commission set some important measures that intend to promote alternative technologies, namely established a reduction of 60% motor vehicle tax for hybrid-vehicles (electrics vehicle were already free of tax for values under 62.500€), fixed an increase of the environmental component of the same tax, and it was also set a new carbon tax over fossil fuels. Still it was re-established the incentive concerning the close out of old vehicles (more than 10 years) throughout a fee to investment in electric vehicles or hybrid vehicles. So far, these measures cause no impact in transport sector.

Programme of the European Union

What are your key recommendations for a future EU governance system?

- Define binding 2030 targets to each country, accompanied with a revision of the RES Directive would give the confidence for investors to continuing to develop the RES sector. Also, this would contribute greatly to reduce energy dependency and consequently increase EU competitiveness.
- Promote energy source diversification throughout mechanisms that allows fare attractiveness for all competitive renewable technologies.
- Endorse decarbonisation measures for all activity sectors encouraging the investment in RES-H&C technologies through financial incentives.
- Increasing transportation efficiency and promoting the rapid deployment of electric vehicles, mainly through promoting the expatiation of fast charging infrastructures and invest in accelerating and diversifying the public and private RD&I sector to improve battery technology.

What are your key recommendations for a future EU energy market design?

- It is imperative a harmonization of regulatory mechanisms, financial incentives taxation and subsidies for all technologies to create a real and competitive energy market.
- Increase the existing electric interconnections to promote the competitiveness between technologies, enhance and combine their complementariness, as well as, create effective energy markets.
- More transparent, participatory and collaborative discussions among countries, mainly between TSOs and supporting research, to improve understanding of mutual impacts, interactions and benefits that may be gained from these efforts.
- Different member's states face different specifications, which mean that national regulations shall be aware of their particularities, namely concerning the right to define its own annual energy mix and security of supply.
- Create conditions to allow increase of production of renewable electricity where it is more cost efficient and avoid "country protection" that limits the true electricity market.

SPAIN

Maria Prado

Spanish Renewable Energy Association (APPA)

Asociación de Productores de Energías Renovables (APPA)

www.appa.es

mariaprado@appa.es

Two new laws have been finally approved

The New Royal Decree 413/2014, 6th June, establishes a new economic retribution system for renewable energy, cogeneration and waste; and the Ministerial Order IET 1045/2014, which provides the type of facility and the corresponding remuneration parameters. With this law the Government almost culminates the Spanish electricity reform that represents a hard blow to the renewable sector. Pending regulations regarding interruptibility and capacity payments can still impact significantly the existing and future installations.

Status of the RES production in Spain

- A new fiscal measure has been applied to all types of energy sources used for electricity production in the form of a 7% flat rate tax on the gross revenues of electricity sales. This tax is applied retrospectively to already existing plants and is discriminatory against RES benefiting from the FiT who cannot pass it on to the consumers (the wind sector could – as long as they participated in the market until beginning of February 2013). On top of this measure, the part of the electricity generated out of gas (max. 15% in the current regulation) for CSP plants was not subject to the FiT any longer. Legal actions have been pursued.
- Additionally, the Spanish Government adopted a moratorium already in January 2012. This sudden stop to FiT programs unlimited in time led to loss of investors' confidence in the sector and the bankruptcy of many companies and massive employment destruction (according to a Deloitte study, some 36,400 jobs have been destroyed between 2008 and 2011 and around 21,800 were created in the CSP sector, leading to a net loss of 15,000 jobs).
- The renewable energy sector in Spain experienced an unexpected and inexplicable regression in all sectors, suffering backdate refund and reforms in their remuneration.
- Recent regulatory changes cast serious doubt on the fulfilment of the targets of renewable energies in Spain in the future. Disappearance and delocalization of the RES sector in Spain (industrial, promotion and development) are currently being a reality, with the subsequent loss of business fabric, thousands of jobs and brain drain.
- Spain will not take advantage of the efforts made in the last 20 years, losing the opportunity to maintain its international leadership in this sector.

Programme of the European Union

Policy update in Spain

What is happening in the electricity sector?

The worst possible scenario (presented already in the last KOT updating as a draft of royal decree) has been confirmed thought the Royal Decree 413/2014 of 6 June, regulating the activity of electricity production from renewable energy source, cogeneration and waste and regulating the basis of the new compensation scheme for this facilities; and the Ministerial Order ITC/1045/2014 that provides the type of facility and the corresponding compensation parameters.

This regulation entered into force on the 11th of June 2014 but it will apply retrospectively since the 14th of July 2013. It undertakes a deep review of the economic scheme and also modifies their rights and obligations as well as the administrative procedures related to them.

It can be summarised in the following points:

- Renewable facilities will receive Capacity Payments (compensation for expenditures) depending on the installed power, and only those that have a higher cost of operation to the market price, will receive a payment for the energy generated. In both cases, the retribution shall be complementary to the price obtained in the wholesale electricity market. Specific remuneration will be: term per unit of installed capacity (R inv) + term per operation (Ro).
- The new remuneration system is based on Type Facilities that will get a pre-tax return of 7.39% over its lifetime. This number is considered as a “reasonable profitability”. Therefore, past earnings are taken into account in calculating future retribution. As an example, the wind farms built before 2005 will not receive any additional retribution to the market price.
- This “Reasonable Profitability” is only assured for a regulatory period of 6 years but with option to be changed through a draft law. In addition, the parameters are open to be changed every half regulatory period (3 years) with the exception of the lifetime and profitability.
- One of the most troubling aspects of the law is that renewable generation no longer has Priority Dispatch. The renewable energy will have priority dispatch only if there is equality in the wholesale electricity market deals. Any fossil generation that bid below the cost of renewable energies will enter in the market and displace renewable generation.
- This new payment scheme based in power capacity and strong retroactive pay cuts will cause the loss of renewable resource and that many facilities have to close because they cannot get a reasonable return on their investments.
- For eligible installations, the remuneration per operation-Ro-, there is a maximum number of hours of operation.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

- Develops the concept of "Joint Facilities", by which is considered a unique facility of two projects for the sake of sharing evacuation infrastructure or those that are located at distances of 500 to 2,000 meters.
- The electricity reform has eliminated the efficiency and reactive power bonus for existing plants, just as they have tightened the technical criteria to be met by the facility (reactive, control centres, power etc.).

What is happening in the heating and cooling sector?

No major changes from last document presented (September 2014) and no regulatory revisions are considered.

What is happening in the transport sector?

In 2014 the biofuels consumption mandates have been maintained at the levels established for 2013 and successive years by Law 11/2013: an overall biofuels target of 4.1% in energy terms and specific biodiesel and bioethanol targets of 4.1% and 3.9%, respectively.

In April 2014, it was published in the Official Journal the resolution from the Secretary of State for Energy that includes the list of raw materials (UCO and category 1 & 2 animal fats) for the production of double counting biofuels in Spain for the fulfilment of the consumption mandates. However, further regulatory developments regarding management and control are pending before the double counting mechanism is fully operative.

In May 2014 the biodiesel quota system entered into force in Spain. Therefore, from that date, only the biodiesel produced in plants with allocated production quantities qualifies for the mandate.

Although the sustainability criteria for biofuels have been formally transposed into Spanish legislation, they are not yet mandatory. The national scheme was set in the Royal Decree 1597/2011 and the Circular 1/2013 of the CNE, however, the implementation of the national scheme was delayed by Law 11/2013 which established an indefinite grace period.

Programme of the European Union

SWEDEN

Sweden's potential for RES is poorly exploited, but now there are great opportunities as well as threats

Sweden is a country with very good conditions for the production of renewable energy, primarily from hydro, biomass and wind. The National Energy Commission that recently started to work and the EU Energy Union represent significant opportunities to improve the energy policy and significantly increase the production of RES. However, there are threats in form of limitations of the use of biofuels in the EU and increased taxation of renewable electricity.

Status of the RES production in Sweden

In 2014, wind mills produced 11.5 TWh of electricity and hydropower plants 63 TWh. For wind power, this means an increase of 16% from 2013. For hydropower, variations among years are caused by the weather. Total energy supply from biofuels in 2013 was 128 TWh.

Low prices for certificates and electricity, as well as expansion restrictions from the Swedish Armed Forces, hold back the expansion of wind power. Complicated administration poses a major obstacle to the development of the small-scale hydropower.

The preliminary share of renewable energy in the transport sector was 18.7% in 2014. What will happen in the future is very uncertain due to lack of political decisions and low profitability rate. The target for 2020 is 10%.

Policy update in Sweden

Sweden is a country with very good conditions for the productions of renewable energy, primarily for hydro, biomass and wind. The National Energy Commission presents significant opportunities to improve the energy policy and increase the production of RES.

What is happening in the electricity sector?

There were no major changes since 2014. However, the inefficient certificate system is still remaining. Prices for electricity and electricity certificates are low mainly because there is a surplus production of electricity and that the transmission capacity to other countries is not good enough to allow the export of large scale. The military still retains its resistance to wind power on large areas of land. Increased taxation of small-scale renewable electricity is proposed.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

What is happening in the heating and cooling sector?

There were no major changes since 2014. Local authorities can oblige homeowners to connect to the district heating network, even if they want to use other renewable energy for heating. Construction requirements for buildings energy consumption have not been strengthened. Incentives to save heat and electricity throughout building and industrial systems are lacking. Still a large proportion of, mainly smaller, houses are heated with electric radiators.

What is happening in the transport sector?

Great uncertainty still exists since the Government did not get through their forestay on a quota obligation for biofuels. Generally, there will be a continued tax exemption for most high-blend and pure biofuels. However, the Government has proposed a tax on FAME (Fatty Acid Methyl Ester) and ethanol (E85) that could lead to a significant reduction of the consumption of these biofuels, with the result that many small-scale producers of FAME will be knocked out. The reason is that these fuels received a tax exemption which led to their price decrease more than for the corresponding fossil fuels. This is not allowed under EU state aid rules. Another threat is also that in the EU limitations of the use of biofuels is proposed. It is unclear about what the Government will do next. Sales of high-level blended ethanol in gasoline, E85, have declined as sales of ethanol cars almost ceased out after the subsidies of them were removed in January 2011.

What are your key recommendations for a future EU governance system?

Focus on the targets: increased use of renewable energy, reducing greenhouse gas emissions and increasing energy efficiency.

EU legislation must not go too deep in detail level, and then it is important to have a flexibility that allows that the national legislation may take into account national and regional specificities. EU legislation should point out the direction and then allow the detail of the legislation to be done nationally accordingly national characteristics.

It is important that there is a freedom in the design of national (regional) legislation where necessary.

Unnecessary administrative barriers must be avoided. It is important that EU legislation and national regulations are continuously reviewed and the regulations that do not work well continuously are revised.

Co-funded by the Intelligent Energy Europe
Programme of the European Union

The EU should introduce a regulatory framework that facilitates and stimulates the transfer of good technology from frontrunner countries to other countries that can make good use of this technology.

What are your key recommendations for a future EU energy market design?

EU legislation and incentives that accelerate the expansion of the transmission capacity of electricity between EU countries, regions and areas should be urgently introduced. E.g. the overproduction of electricity in northern Europe could be sold to other EU countries and there could displace fossil energy primarily fossil coal but also natural gas. Let northern Europe, with its great potential in terms of renewable energy, be allowed to become Europe's green battery.

It is important that countries that want move faster the expansion of renewable energy and energy efficiency can do this without EU legislation prevent this. If this is found to be the case, the EU regulatory framework must be revised.

It is important that the countries of northern Europe are allowed to go before the rest of the EU as regards the introduction of biofuels for transport. This applies both to get to keep the current high use of first-generation biofuels and that the development and introduction of second and third generation biofuels are facilitated. It is important that these countries are allowed to build their future prosperity of these biofuels.

Programme of the European Union

UNITED KINGDOM

Frank Aaskov
 Renewable Energy Association (REA)
www.r-e-a.net
 faaskov@r-e-a.net

The UK renewables market is currently active but mixed political signals continue to undermine confidence

The renewable electricity and heat sectors continue to show good levels of activity despite a difficult political landscape. Support costs are likely to continue to feature strongly after this year's general election. There are concerns that the government lacks a long-term commitment to renewables and that momentum will slow as we approach the 2020 target date.

Status of the RES production in the UK

Renewable electricity generation was 17.9% of gross electricity consumption in 2014 and in the heat sector the Renewable Heat Incentive has boosted deployment of particular biomass and biomethane. Progress on renewable transport has stalled due to policy uncertainties at both EU and national level. Policy risk and uncertainty in the market remain the key barriers affecting all renewable technologies across all sectors.

Policy update in the UK

What is happening in the electricity sector?

The UK's support for larger scale renewable electricity has undergone major transformation with the replacement of the Renewables Obligation by a 'Contract for Difference' mechanism in line with the requirements under the new EU state aid guidelines. The electricity sector has therefore mostly been preparing itself for the first auction based allocation round in Q1 2015, which illustrated some problems with the mechanism (i.e. certain technologies dominated, projects commissioning at end of decade, and two unsigned contracts). The auction allocation did, however, on average provide a 20% subsidy reduction, and 2.1 GW procured from 5 different technologies over 26 contracts.

Planning consent of renewable energy is still a contested issue. The Conservative Party will end subsidy for new onshore wind farms if they enter into Government after the 7 May election. The Liberal Democratic Party has signalled disdain for large scale biomass. The Department of Energy and

Co-funded by the Intelligent Energy Europe
 Programme of the European Union

Climate Change, led by the Conservatives and Lib Dems, has prematurely ended subsidy for solar farms.

In 2014, on the Renewable Energy Directive basis, renewable generation was 17.9 per cent of gross electricity consumption, an increase of 4.1 percentage points on 2013's share. Renewable electricity capacity increased 23% to 24.2 GW at the end of 2014, and the renewable electricity generation increased 20% to 64.4 TWh in 2014, with bioenergy up by 24 per cent and wind generation up by 11 per cent.

However, large digressions in the Feed-in Tariffs and a solar FiT review have created uncertainty for the small scale market.

What is happening in the heating and cooling sector?

The Renewable Heat Incentive (RHI) has supported a relatively large uptake of installations, which primarily have been biomass and now also biomethane. The domestic RHI has been successful in supporting deployment of biomass boilers in accordance with government expectations, but has been ineffective in incentivising significant uptake of heat pump and solar thermal installations. Large digressions have made RES-H&C installations less attractive, threatening the long term growth of the industry, and, with current growth, the UK won't hit its 2020 RES-H&C target. The government is to introduce sustainability criteria for biomass by October 2015, which has caused the industry grievances, due to the very tight timeframe of implementation. Furthermore, the nature of the RHI legislation prevents the government from providing a post-2016 budget, which has created uncertainty for investors.

What is happening in the transport sector?

Support for transport has made very little progress since 2014, for two key reasons – the absence of a final decision to amend the RED following the Commission's proposals of October 2012 on Indirect Land Use Change (ILUC) and the impending UK General Election in May 2015. Some small progress has been made to increase the support for gaseous fuels and to treat HVO biodiesel in the same way as FAME biodiesel (both are partially renewable fuels and will now be treated as wholly renewable). In addition a Transport Energy Task Force of a wide range of stakeholders (UK Government departments, renewable and fossil fuel and agricultural industries, NGOs, vehicle and aviation industries) has developed a report for incoming Ministers after the General Election with recommendations on how the UK should meet its RED targets to 2020 and continue to de-carbonise transport out to 2030. It is hoped that early Ministerial decisions will allow the RES-T policy to move forward in late 2015, after a prolonged period of stagnation.
